PYTHON FOR DATA ANALYTICS
PROJECT SUBMISSION TEMPLATE

Hospital Patient Data Analysis

STUDENT NAME : PRIYADHARSHINI A
YEAR : III B.Sc Computer Science
COLLEGE NAME : Government Arts and Science College for Women
DEPARTMENT : Computer Science
SEMESTER : IV
ROLL NO : 24082131802112133
NM ID : 53115D38599743DA6A54EE0E2DE11636
TITLE : Hospital Patient Data Analysis
GITHUB LINK :
DATE : 21.06.2026

1. ABSTRACT

This project focuses on analyzing hospital patient records to improve healthcare service efficiency and identify common diseases affecting patients. A hospital dataset containing patient details such as age, disease, admission date, discharge date, and treatment information is analyzed using Python Data Analytics techniques. Data cleaning is performed to handle missing values, remove duplicates, and ensure data consistency. Exploratory Data Analysis (EDA) is used to understand disease distribution, patient demographics, and admission patterns. Visualization techniques are applied to represent trends using charts and graphs. The project helps hospital management understand patient flow, identify peak admission periods, and make informed decisions regarding resource allocation and healthcare planning.

2. PROBLEM STATEMENT

Hospitals generate large amounts of patient data every day. Manual analysis of these records is difficult and time-consuming. Without proper analysis, hospitals may face challenges in resource planning, disease monitoring, and patient management. Data analytics helps transform raw patient data into meaningful insights that improve healthcare services.

3. OBJECTIVES

- Clean and preprocess hospital patient data.
- Analyze patient count by disease.
- Study patient distribution by age group.
- Identify peak admission periods.
- Visualize patient trends using charts.
- Generate useful insights for hospital management.

4. PROJECT SCOPE

The project focuses on analyzing hospital patient records using Python in Google Colab.

- The scope includes data cleaning,
- Exploratory data analysis
- Visualization
- Reporting

The analysis supports healthcare decision-making and resource management.

5. TECHNOLOGIES USED

Development Environment: Google Colab

Programming Language:

- Python

Libraries Used:

- Pandas
- NumPy
- Matplotlib
- Seaborn

Dataset Source:

- CSV File containing hospital patient records

6. APPLICATION FLOW

Step 1: Load Dataset

Step 2: Data Cleaning

Step 3: Handle Missing Values

Step 4: Remove Duplicate Records

Step 5: Disease Analysis

Step 6: Age Group Analysis

Step 7: Admission Trend Analysis

Step 8: Create Visualizations

Step 9: Generate Final Insights

7. KEY PYTHON DATA ANALYTICS CONCEPTS USED

1. Data Handling using Pandas
2. Data Cleaning
3. Exploratory Data Analysis (EDA)
4. Data Visualization
5. Grouping and Aggregation
6. Trend Analysis

8. EXPECTED OUTPUT

Dataset Preview

The screenshot shows a Google Colab notebook titled "Untitled0.ipynb". The code cell [1] contains the following Python code:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns

print("Libraries Imported Successfully")
```

The output of the code cell is "Libraries Imported Successfully". The notebook interface includes a menu bar (File, Edit, View, Insert, Runtime, Tools, Help), a toolbar (Commands, Code, Text, Run all), and a status bar (Variables, Terminal, 6:49 PM, Python 3).

Dataset Information

The screenshot shows a Google Colab notebook titled "Untitled5.ipynb". The code cell [2] contains the following Python code:

```
df = pd.DataFrame(data)

print("Dataset Created Successfully")
df.head()
```

The output of the code cell is "Dataset Created Successfully" followed by a preview of the first five rows of the dataset:

	Patient_ID	Age	Disease	Admission_Date
0	101	25	Fever	2026-01-05
1	102	45	Diabetes	2026-01-10
2	103	60	Heart Disease	2026-02-15
3	104	34	Fever	2026-02-20
4	105	12	Asthma	2026-03-05

Below the table, there are two buttons: "Generate code with df" and "New interactive sheet". The notebook interface includes a menu bar (File, Edit, View, Insert, Runtime, Tools, Help), a toolbar (Commands, Code, Text, Run all), and a status bar (Variables, Terminal, 7:18 PM, Python 3).

Missing Values Check

The screenshot shows a Google Colab notebook titled 'Untitled5.ipynb'. The code cell [3] contains `df.info()`, which has been executed successfully. The output displays the DataFrame's structure: 10 entries (indices 0-9) and 4 columns. The columns are Patient_ID (int64), Age (int64), Disease (object), and Admission_Date (object). All columns have 10 non-null values. The memory usage is 452.0+ bytes.

```
[3] df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 4 columns):
 #   Column        Non-Null Count  Dtype  
---  -
 0   Patient_ID    10 non-null    int64  
 1   Age           10 non-null    int64  
 2   Disease       10 non-null    object  
 3   Admission_Date 10 non-null    object  
dtypes: int64(2), object(2)
memory usage: 452.0+ bytes
```

Cleaned Dataset

The screenshot shows the same Colab notebook with a second code cell [4] containing `df.isnull().sum()`. The output shows zero missing values for all columns: Patient_ID, Age, Disease, and Admission_Date. The dtype for the result is int64.

```
[4] df.isnull().sum()
Patient_ID    0
Age           0
Disease       0
Admission_Date 0
dtype: int64
```

```
▶ df["Admission_Date"] = pd.to_datetime(df["Admission_Date"])

df["Month"] = df["Admission_Date"].dt.month_name()

monthly_admission = df["Month"].value_counts()

print(monthly_admission)
```

```
... Month
January      2
February     2
March         2
April         2
May           2
Name: count, dtype: int64
```

Monthly Admission Graph

Final Insights

```
is + Code + Text ▶ Run all
```

```
print("\nMost Common Disease:")
print(df["Disease"].value_counts().idxmax())

print("\nTotal Patients:")
print(len(df))

print("\nPeak Admission Month:")
print(monthly_admission.idxmax())
```

... FINAL INSIGHTS

Most Common Disease:
Fever

Total Patients:
10

Peak Admission Month:
January

9. CHALLENGES FACED

- Missing values in patient records
- Duplicate entries
- Incorrect date formats
- Data inconsistency issues
- Large dataset handling

10. LEARNING OUTCOMES

- Learned data cleaning techniques.
- Improved Python programming skills.
- Gained practical experience with Pandas and NumPy.
- Learned data visualization using Matplotlib and Seaborn.
- Developed analytical thinking and problem-solving skills.

11. CONCLUSION

The Hospital Patient Data Analysis project successfully analyzes patient records and provides meaningful insights. The project identifies common diseases, analyzes patient demographics, and determines peak admission periods. The generated insights can help hospitals improve resource allocation, patient care, and operational efficiency. This project demonstrates the importance of data analytics in the healthcare sector.
